

Tripleplay Cloud IPTV and Caching Servers.

Tripleplay by Uniguest Cloud IPTV and Caching servers provide a range of benefits and additional functionality to Tripleplay Cloud customers.

Uniguest IPTV Server

A simple two slot IPTV Server which provides a range of live TV, streaming and caching services.

Two additional add in cards can be installed for ingesting a range of live TV sources, including terrestrial, satellite, cable, or HDMI. The IPTV server then delivers content from these inputs as streams over the network. Users can choose to encrypt streams for an added layer of security.

Channels provided by the local IPTV server are presented in the Tripleplay Cloud management interface, making it easy to assign channels to a variety of local end points. Such as, digital signage or live TV/ VOD portals.

In addition, Uniguest's IPTV server also acts as a caching server to preserve valuable internet bandwidth for other services.

- Two slot server which can accommodate a range of add in cards for ingesting live TV
- Compact 1U rackmount form factor for easy installation
- Also acts as caching server to preserve bandwidth
- Easily encrypt streams for security
- Available with single or dual power supply

Uniguest Caching Server

Uniguest's Caching Server significantly increases bandwidth efficiency. Instead of content downloading from the public cloud to each end point, content will be downloaded once to the caching server. End points will then use the local area network to download or stream the content.

- Preserves internet bandwidth by reducing the amount of content downloaded from Tripleplay Cloud to local devices
- Simple, cost-effective form factor
- Useful for locations such as offices with high concentration of users streaming video from the cloud
